SWMM Calibration and Sensitivity Analysis for Bioretention

Patrick O'Hara, EIT
Department of Civil, Environmental, and
Ocean Engineering
Advisor: Elizabeth Fassman-Beck, PhD
AAEES/NJWEA Workshop on Green
Infrastructure – May 2018

Storm Water Management Model (SWMM)

- Produced by the US Environmental Protection Agency
- Dynamic hydrology-hydraulic water quality simulation model
- Low Impact Development Controls were introduced as part of SWMM 5 in 2009

Objective

- Evaluate the accuracy of SWMM's LID controls using data collected from GI implementations at Stevens
 - Sensitivity analysis
 - Model calibration and validation
- Few published studies have evaluated the accuracy of SWMM with LID
- Accurate models critical to evaluating design alternatives, determining regulatory compliance, etc.

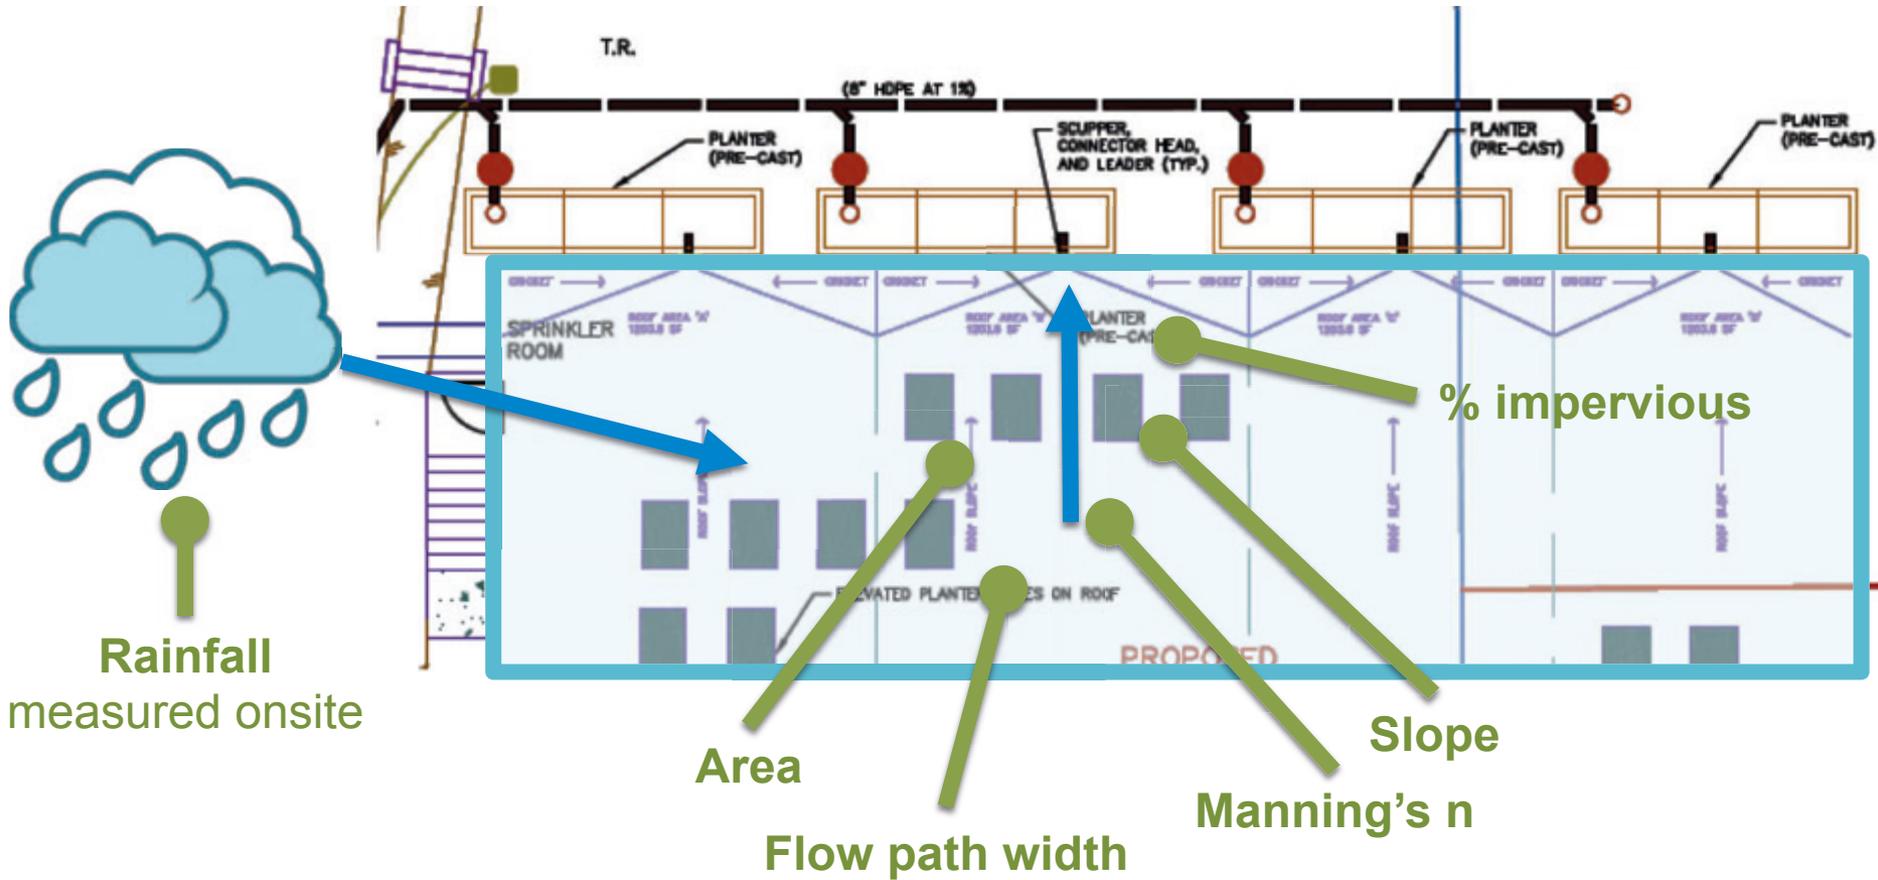

Site Characteristics

Planter acts as a **bioretention cell** to manage roof runoff

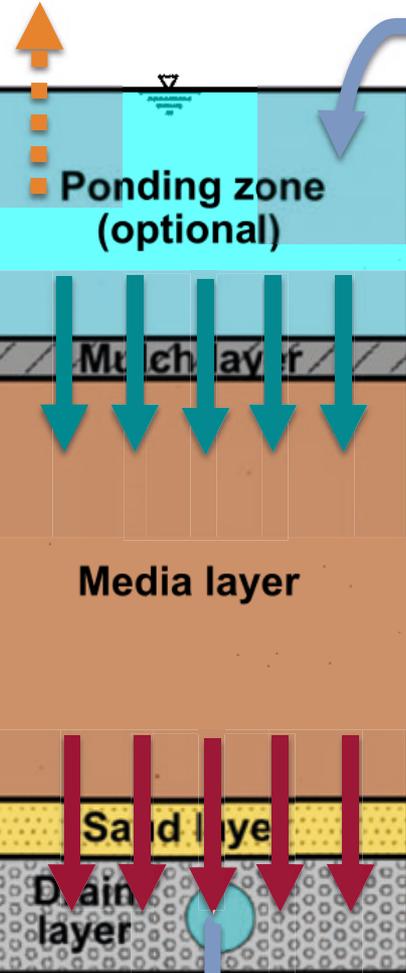

Planter Modeling

How SWMM Models LID Controls

Evapotranspiration
from field measured ET rates
or estimates from temperature

Inflow
SWMM runoff computations
for drainage area

**Infiltration from ponding
zone to media layer**
Green-Ampt infiltration model

Soil percolation
modeled using Darcy's law

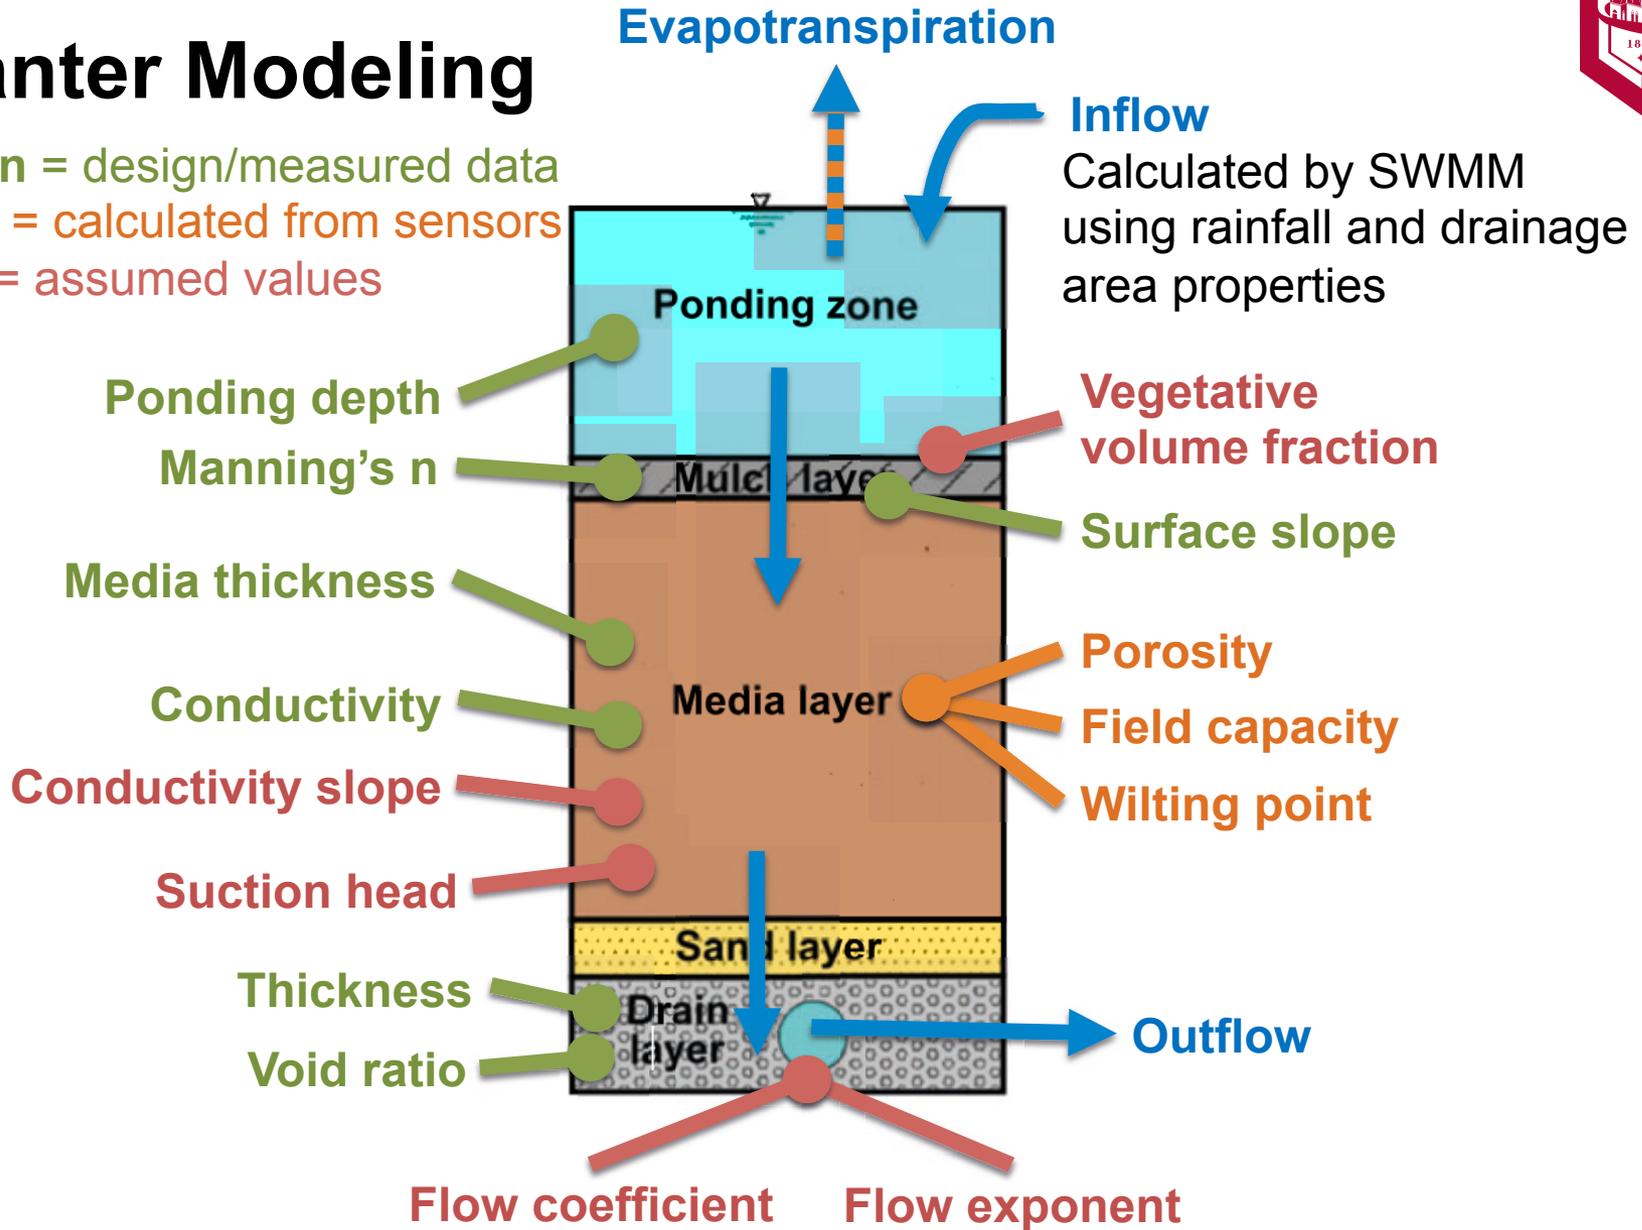

Drainage
Empirical power law

Planter Modeling

Green = design/measured data

Gold = calculated from sensors

Red = assumed values

Uncalibrated Model Accuracy

- Continuous simulation
 - August 8, 2017 to March 14, 2018
 - 32 rain events (total P = 14.85 in)
- Model efficiency: Nash-Sutcliffe efficiency coefficient (NSE)
 - Ranges from $-\infty$ to 1
 - $\eta = 1 \rightarrow$ perfect match
- Continuous simulation NSE: **0.796**
- Individual storms NSE: **0.138 to 0.992**

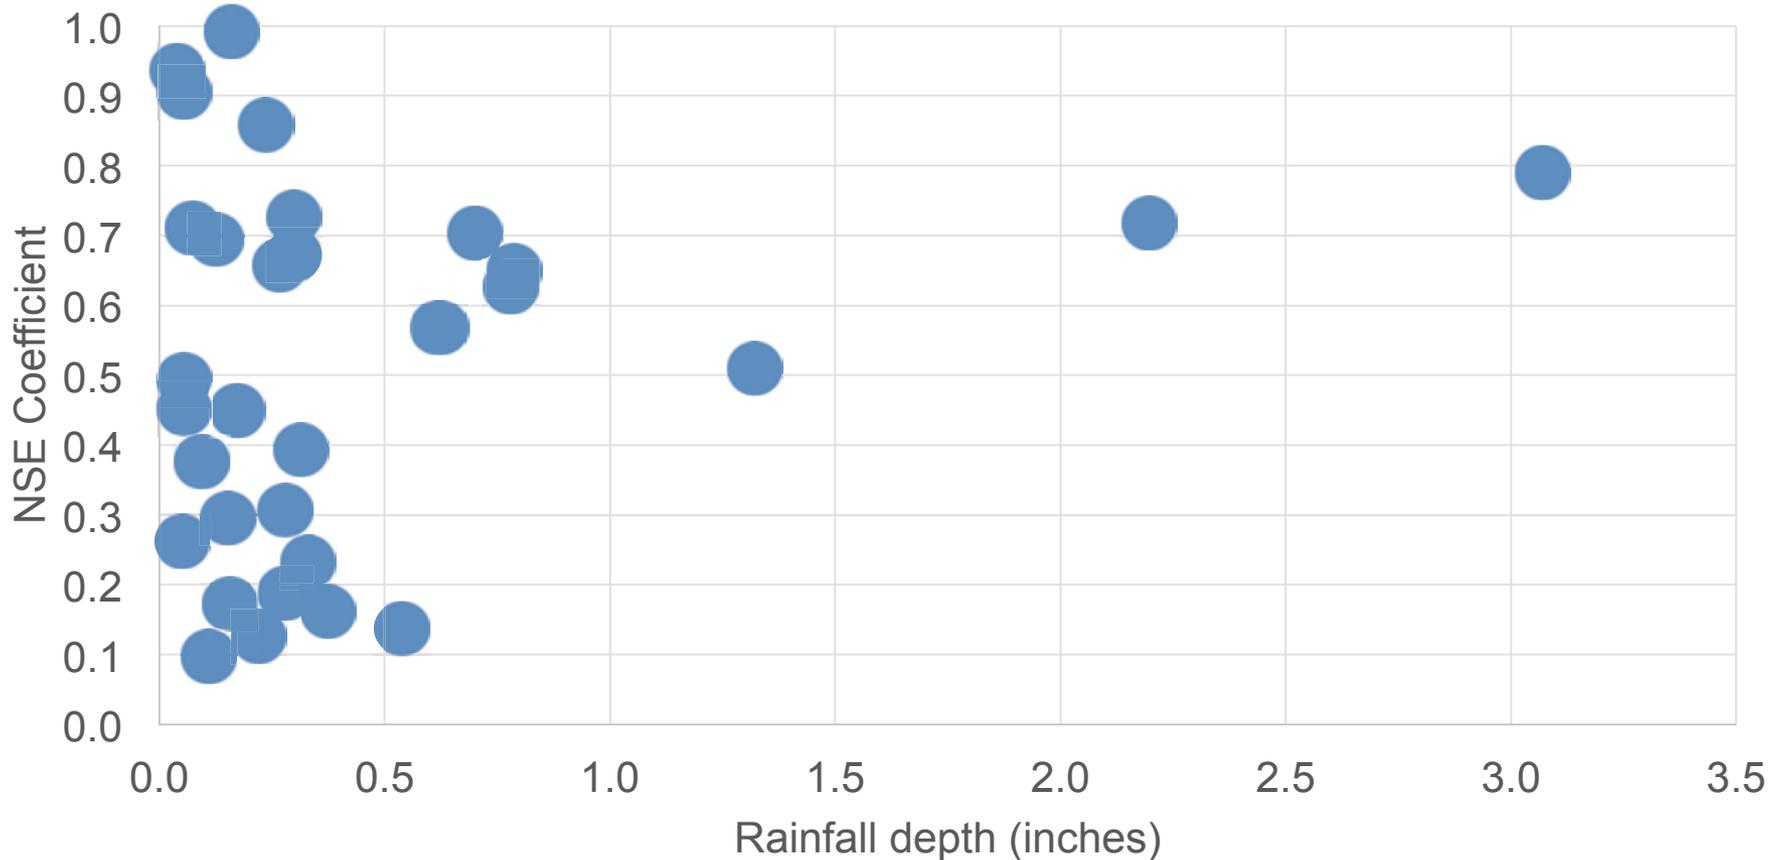

Uncalibrated Model Accuracy

Influence of rainfall depth

SWMM Efficiency for Bioretention Modeling

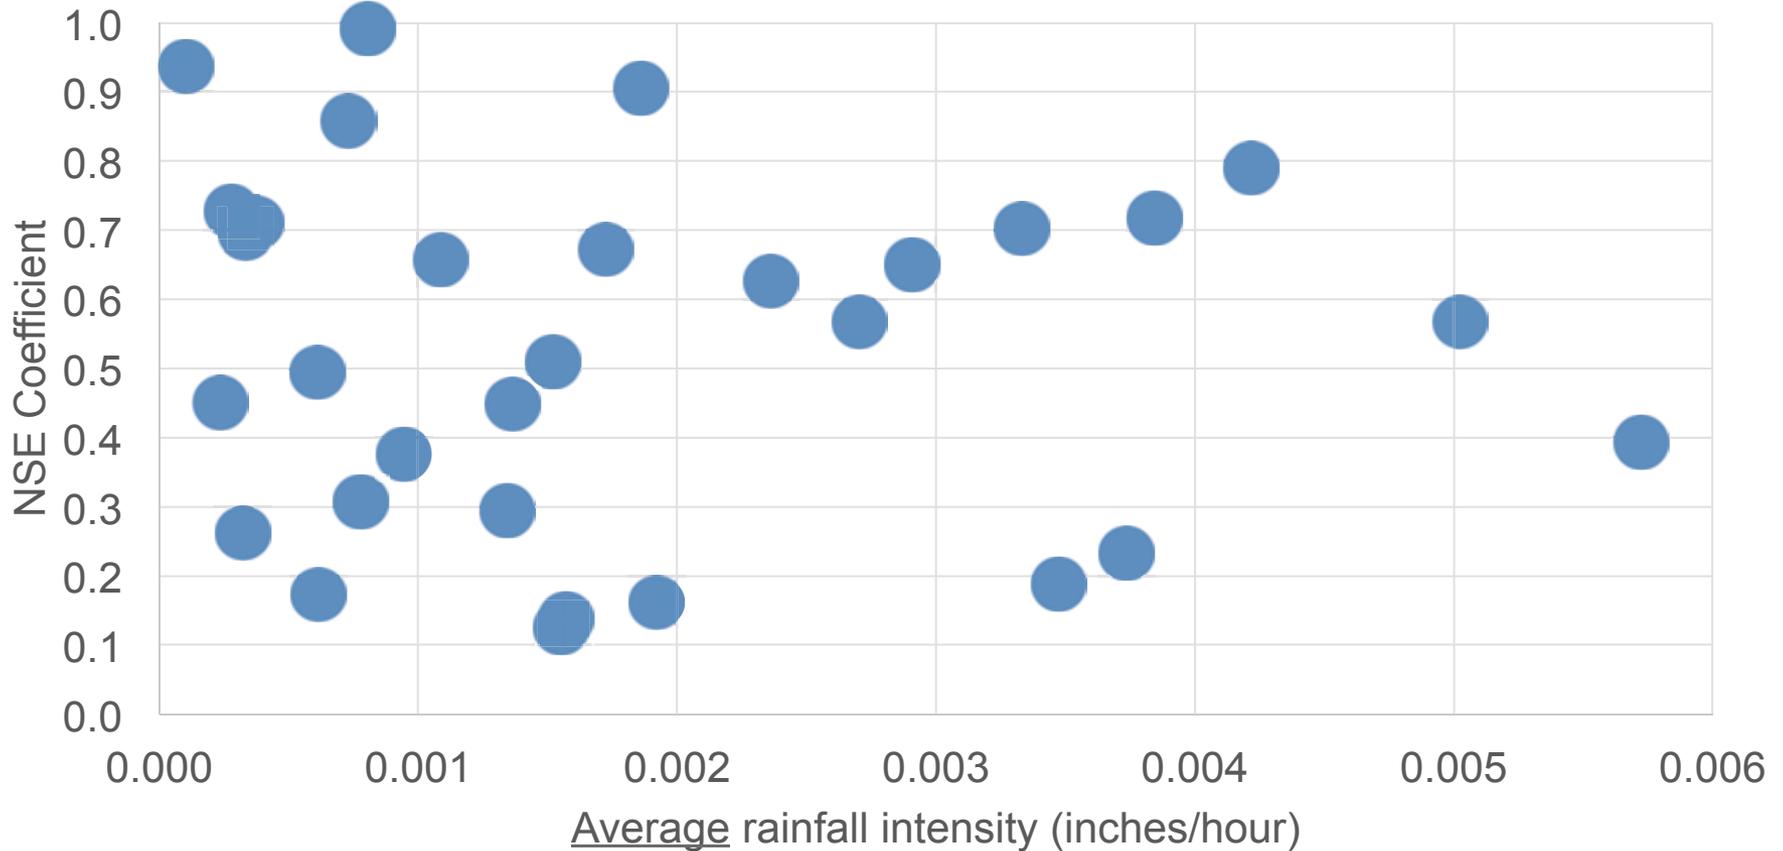

Uncalibrated Model Accuracy

Influence of average rainfall intensity

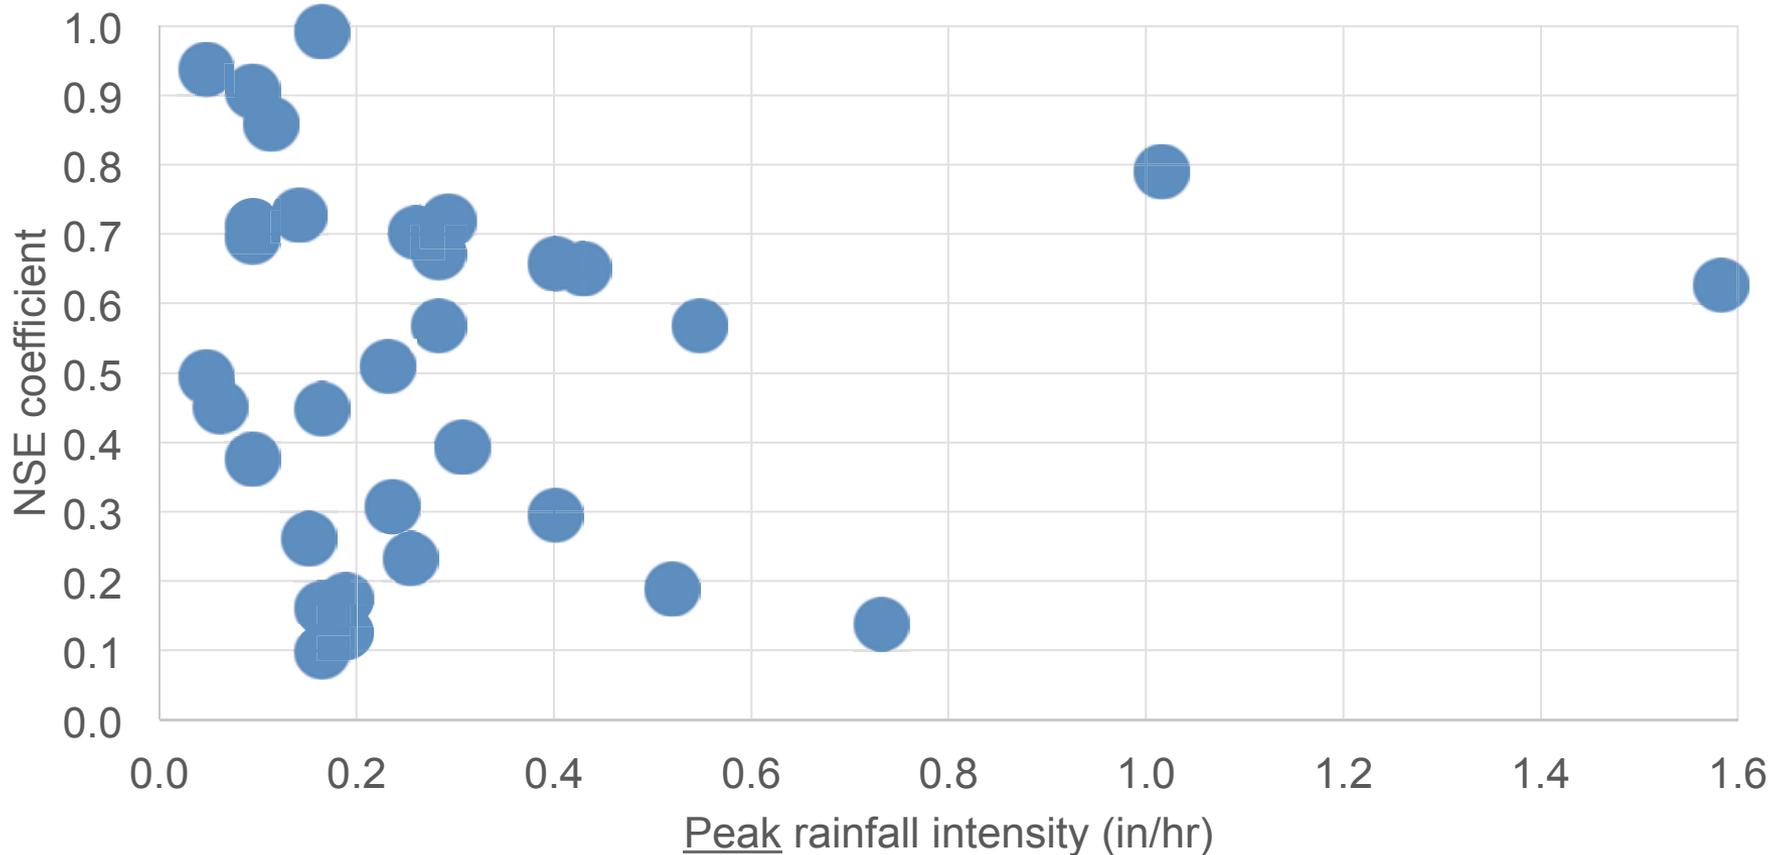

SWMM Efficiency for Bioretention Modeling

Uncalibrated Model Accuracy

Influence of peak rainfall intensity (5-minute peak)

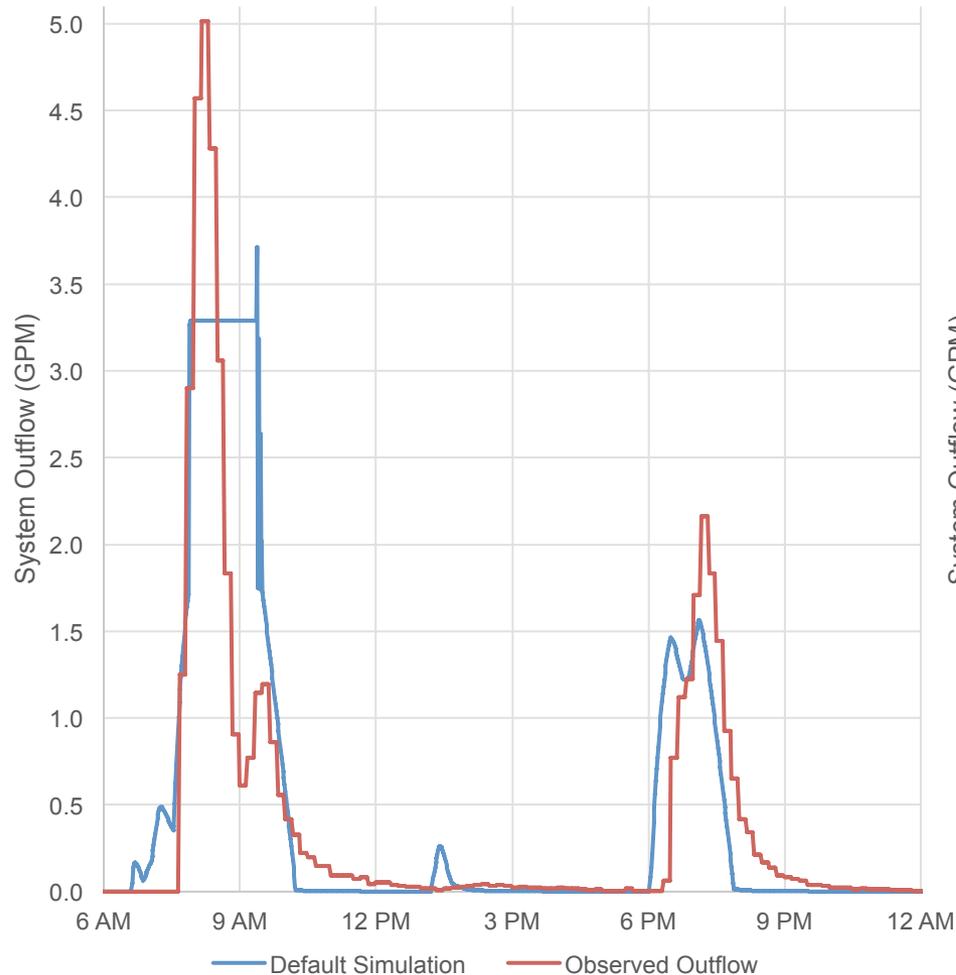

SWMM Efficiency for Bioretention Modeling

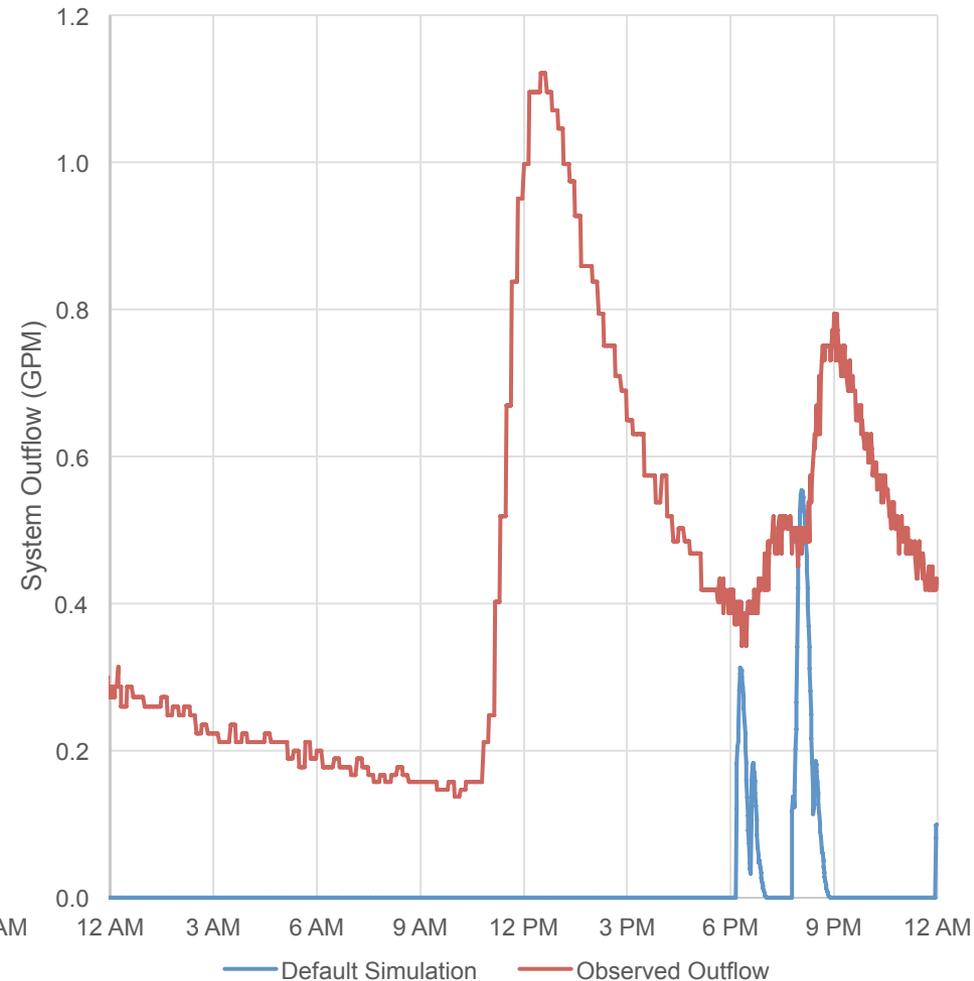

Uncalibrated Model Accuracy

SWMM vs. Observed Flow (Aug. 18, 2017)
(depth = 0.78 in, $\eta = 0.63$)

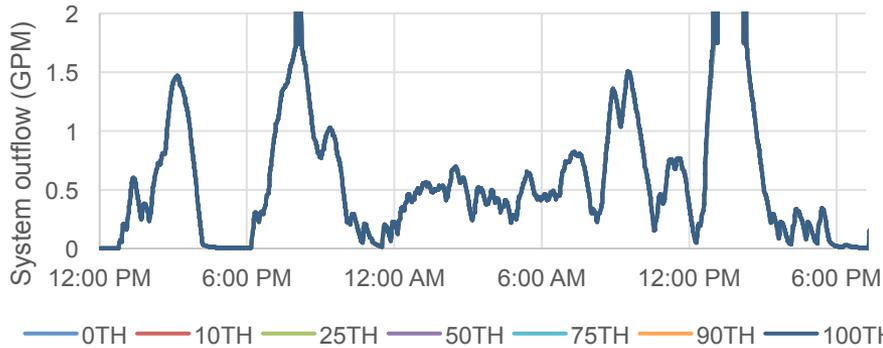

SWMM vs. Observed Flow (Feb. 19, 2018)
(depth = 0.16 in, $\eta = 0.26$)

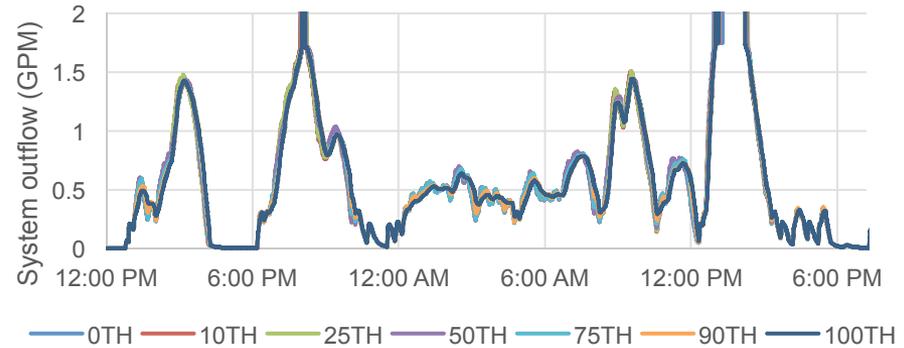

Sensitivity Analysis

Surface Roughness

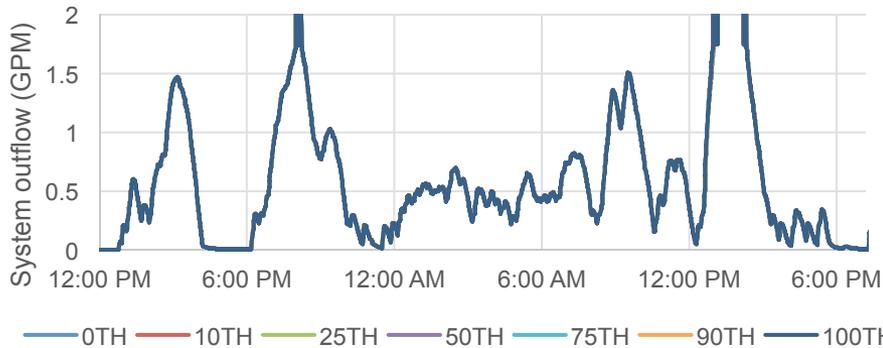

Surface Manning's n	<u>Range</u>	<u>Std. Dv.</u>	No sensitivity
	0.0018	0.0008	

Conductivity Slope

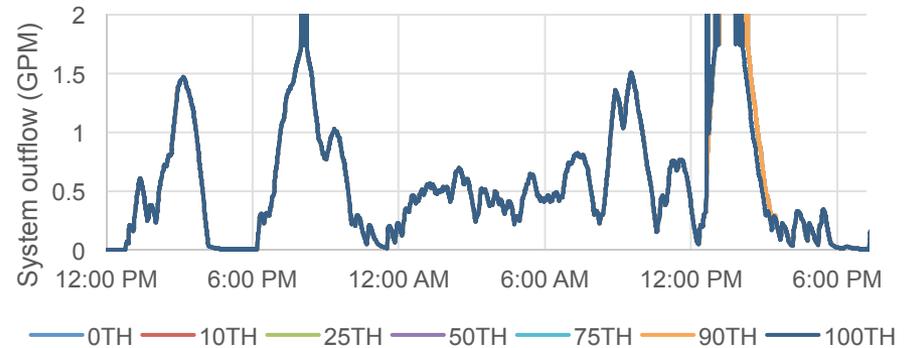

Media Cond'tvty Slope	<u>Range</u>	<u>Std. Dv.</u>	Minor sensitivity
	0.0085	0.0035	

Suction Head

Media Suction Head	<u>Range</u>	<u>Std. Dv.</u>	No sensitivity
	0.0018	0.0008	

Vegetative Volume Fraction

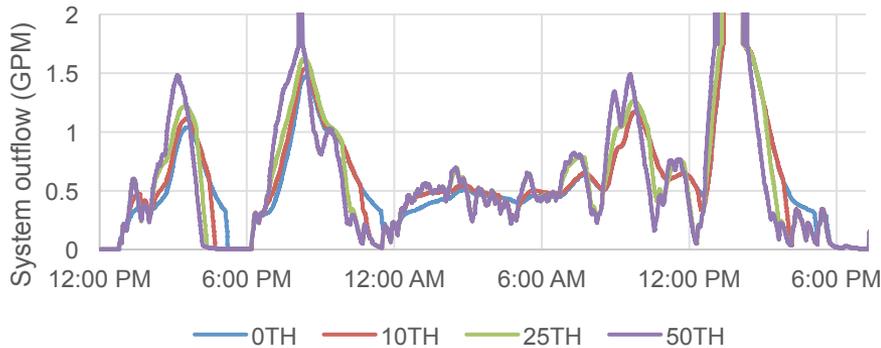

Vegetative Volume Fraction	<u>Range</u>	<u>Std. Dv.</u>	No sensitivity
	0.0078	0.0035	

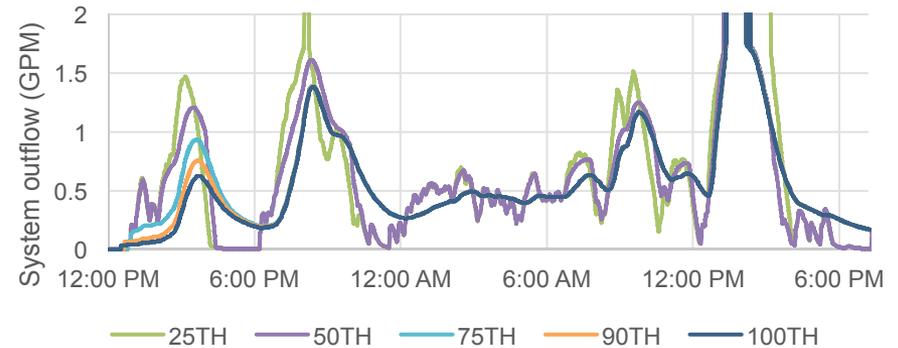

Sensitivity Analysis

Field Capacity

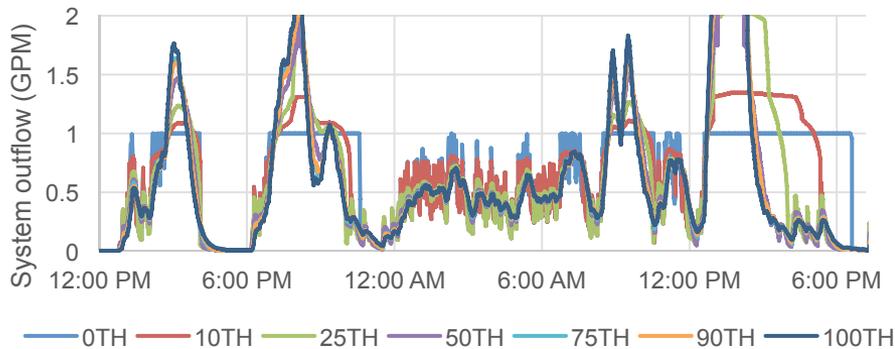

Media	Range	Std. Dv.	High sensitivity
Field Capacity	0.0579	0.0279	High sensitivity

Porosity

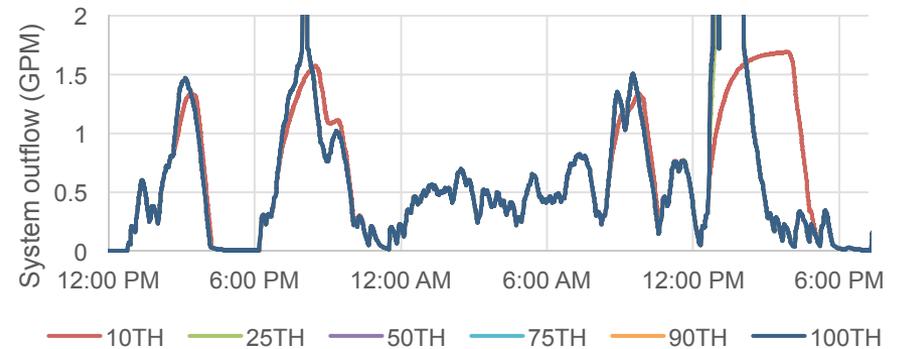

Media	Range	Std. Dv.	High sensitivity
Porosity	0.0686	0.0290	High sensitivity

Flow Exponent

Drain	Range	Std. Dv.	High sensitivity
Flow Exponent	0.0387	0.0153	High sensitivity

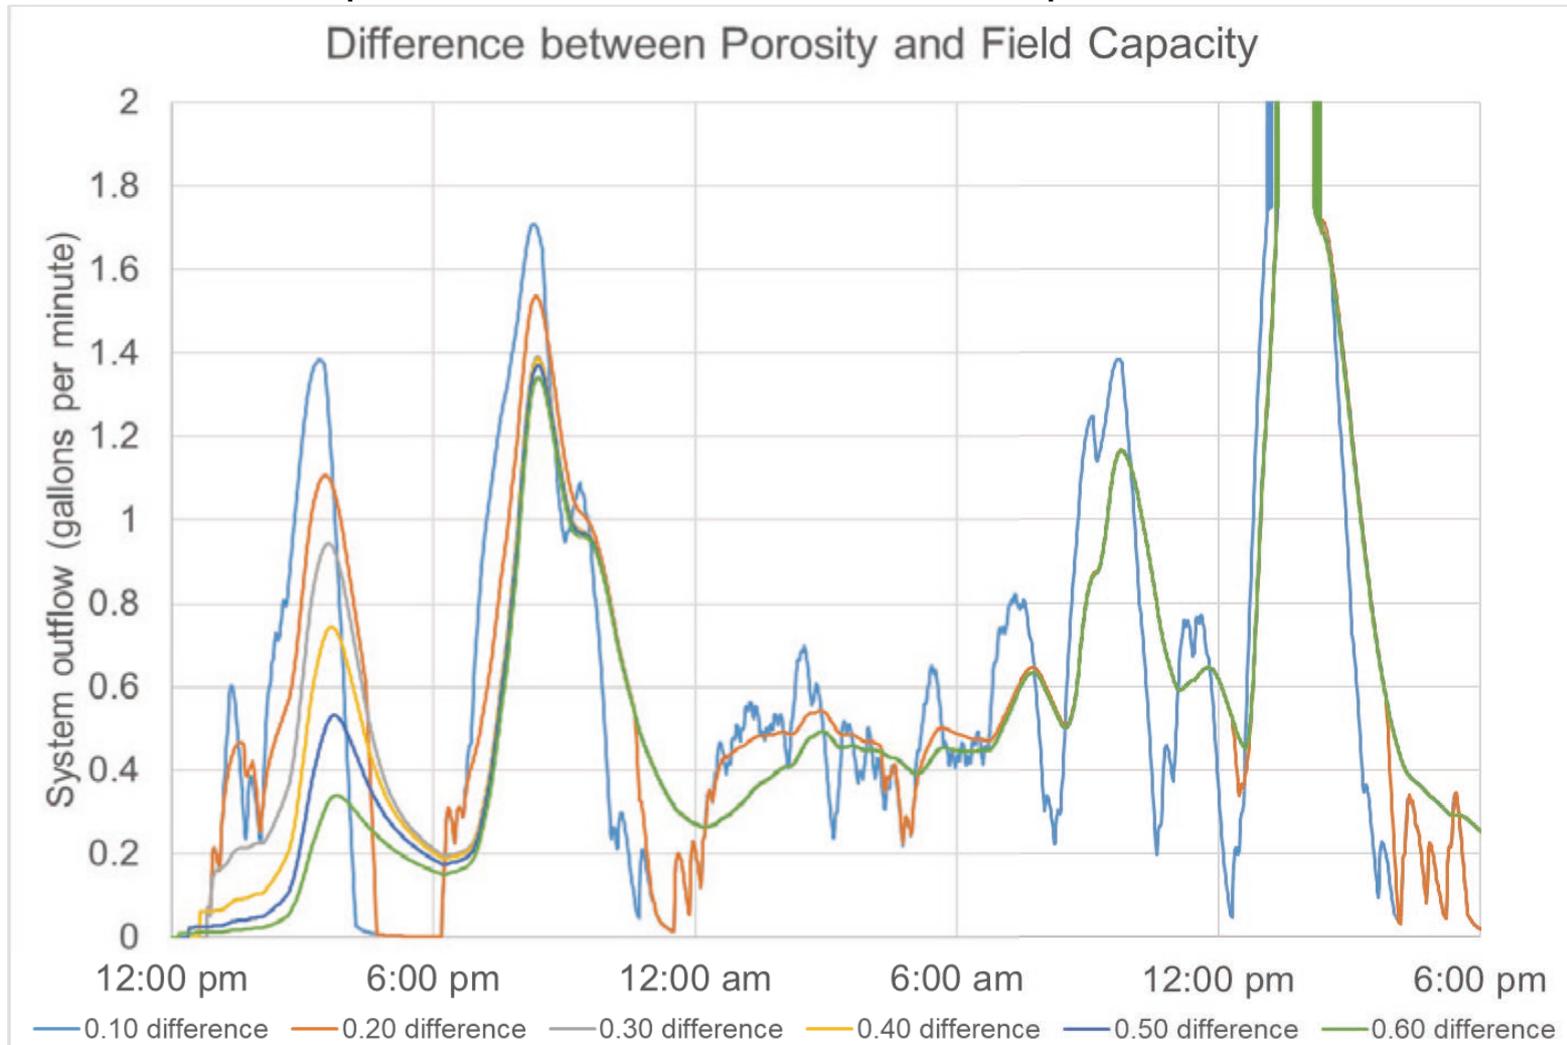

Conductivity

Media	Range	Std. Dv.	Moderate sensitivity
Conductivity	0.0526	0.0197	Moderate sensitivity

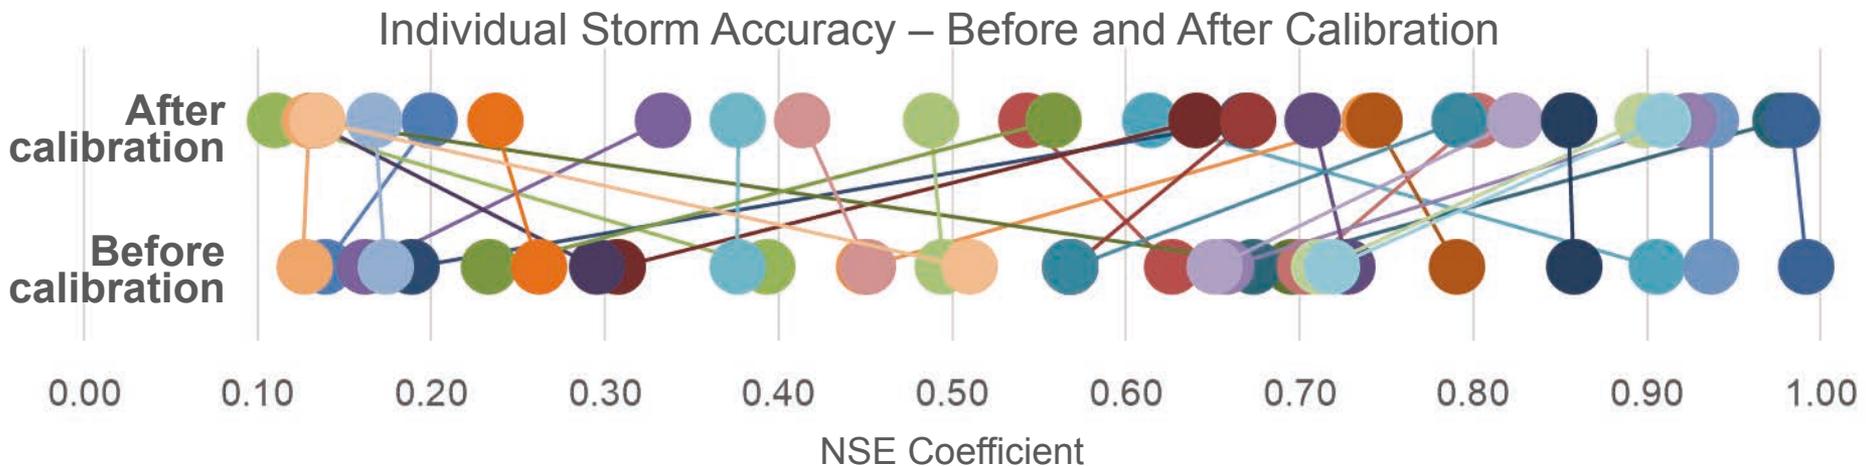

Sensitivity Analysis

Differences between parameter values also had an impact...

Model Calibration and Validation

- March 1, 2018 storm selected for calibration
 - NSE improved from **0.72** to **0.91** (27% improvement)
 - Peak flow error improved **12%**
- Overall continuous simulation improved by 5% to **0.84**.
 - Accuracy for individual storms generally improved, though some got worse

Model Calibration and Validation

- Calibration involved further lowering media porosity and field capacity

Parameter	Sensitivity Test Range	Measured Value	Calibrated Value	Change
Media porosity	0.34 to 0.70	0.290	0.110	↓ 0.180 (62%)
Media field capacity	0.10 to 0.40	0.244	0.100	↓ 0.144 (59%)
Conductivity (in/hr)	0.03 to 11.78	6.600	8.000	↑ 1.400 (21%)
Drain flow exponent	0.00 to 1.00	0.500	0.660	↑ 0.160 (32%)
Storage void ratio	0.25 to 1.00	0.750	0.660	↓ 0.090 (12%)
Wilting point	0.01 to 0.16	0.105	0.001	↓ 0.104 (99%)
Storage depth (in)	N/A	6.000	5.000	↓ 1.000 (17%)
Drain offset height (in)	N/A	3.000	3.500	↑ 0.500 (17%)

Conclusion

- SWMM is a useful tool for continuous simulations over an extended period of time and a range of conditions
- For individual storms, additional evaluation or calibration may be required for reliable results
- Accuracy of simulation highly dependent on measurements for porosity, field capacity, and other media properties
- Seasonal impacts of leaf clogging, snowfall, and snow melt not well accounted for in SWMM
